MINI-ASSESSMENT

Multi-Step Prompt Workflow – AI Meeting Summarizer & Action Planner

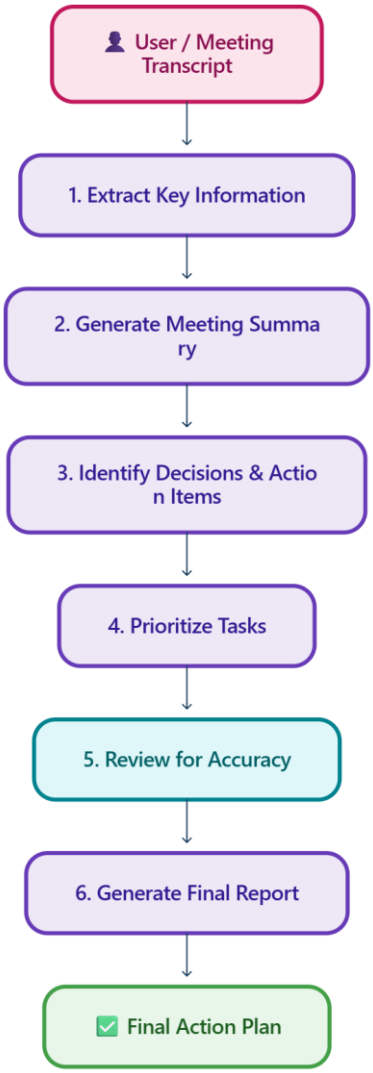

Name: Shaik Thanvir Ahmed
Reg No: 99230040768

1. Objective

The objective of this workflow is to design a multi-step Generative AI prompt workflow that converts meeting notes or a meeting transcript into a structured summary, identifies decisions and action items, assigns priorities, and performs a final quality check.

The workflow uses prompt chaining, information extraction, structured generation, validation, and iterative refinement.

2. Workflow Overview

3. Detailed Workflow Steps

Step 1 – Extract Key Information

Purpose

The first step extracts the important information from the meeting transcript or notes.

Prompt

You are an AI Meeting Analysis Assistant.

Analyze the provided meeting transcript or notes and extract:

1. Meeting topic
2. Participants mentioned
3. Main discussion points
4. Important facts
5. Problems or issues discussed
6. Decisions mentioned
7. Tasks or responsibilities mentioned
8. Deadlines or dates mentioned

Do not create the final meeting report yet.

Organize the extracted information using clear headings and bullet points.

Output

A structured extraction of the important meeting information.

4. Step 2 – Generate Meeting Summary

Purpose

This step converts the extracted information into a concise meeting summary.

Prompt

Using the extracted information from Step 1, create a concise and accurate meeting summary.

Include:

- Meeting purpose
- Main topics discussed
- Important points
- Problems identified
- Decisions made
- Overall outcome

Do not add information that is not present in the source material.

Use professional and concise language.

Output

A structured meeting summary.

5. Step 3 – Identify Decisions and Action Items

Purpose

This step separates decisions from tasks that need to be completed.

Prompt

Using the meeting information and summary from the previous steps, identify all decisions and action items.

For each action item, identify:

1. Task
2. Responsible person, if explicitly mentioned
3. Deadline, if explicitly mentioned
4. Related discussion or objective

Separate the output into:

Decisions Made

Action Items

Do not invent owners or deadlines when they are not present in the source.

Output

A list of decisions and clearly defined action items.

6. Step 4 – Prioritize and Organize Tasks

Purpose

This step organizes the action items according to urgency and importance.

Prompt

Using the action items from Step 3, organize the tasks by priority.

Assign each task one of the following priority levels:

- High
- Medium
- Low

Base the priority only on information available in the meeting notes, such as deadlines, business importance, dependencies, or urgency.

If priority cannot be determined confidently, mark it as "Needs Review."

Present the result in a structured table with:

Task | Owner | Deadline | Priority | Reason

Output

A prioritized action-item table.

7. Step 5 – Review for Accuracy

Purpose

This step validates the generated summary and action plan against the original meeting information.

Prompt

Act as a meeting-report quality reviewer.

Compare the generated summary and action plan with the original meeting transcript or notes.

Check for:

1. Missing important information
2. Incorrect information
3. Invented decisions
4. Invented deadlines
5. Incorrect task ownership
6. Misinterpretation of statements
7. Duplicate action items
8. Unclear wording

For each issue found, provide:

Issue:
Evidence or reason:
Recommended correction:

If no significant issue is found, state that the information passed the review.

Output

A validation report containing errors and corrections.

8. Step 6 – Generate Final Meeting Report

Purpose

This step combines the validated information into a professional meeting report.

Prompt

Using the meeting summary, decisions, action items, priorities, and validation feedback from the previous steps, generate the final meeting report.

Use this structure:

1. Meeting Title
2. Meeting Overview
3. Executive Summary
4. Key Discussion Points
5. Decisions Made
6. Action Items
7. Priority and Deadlines
8. Issues Requiring Follow-up
9. Next Steps

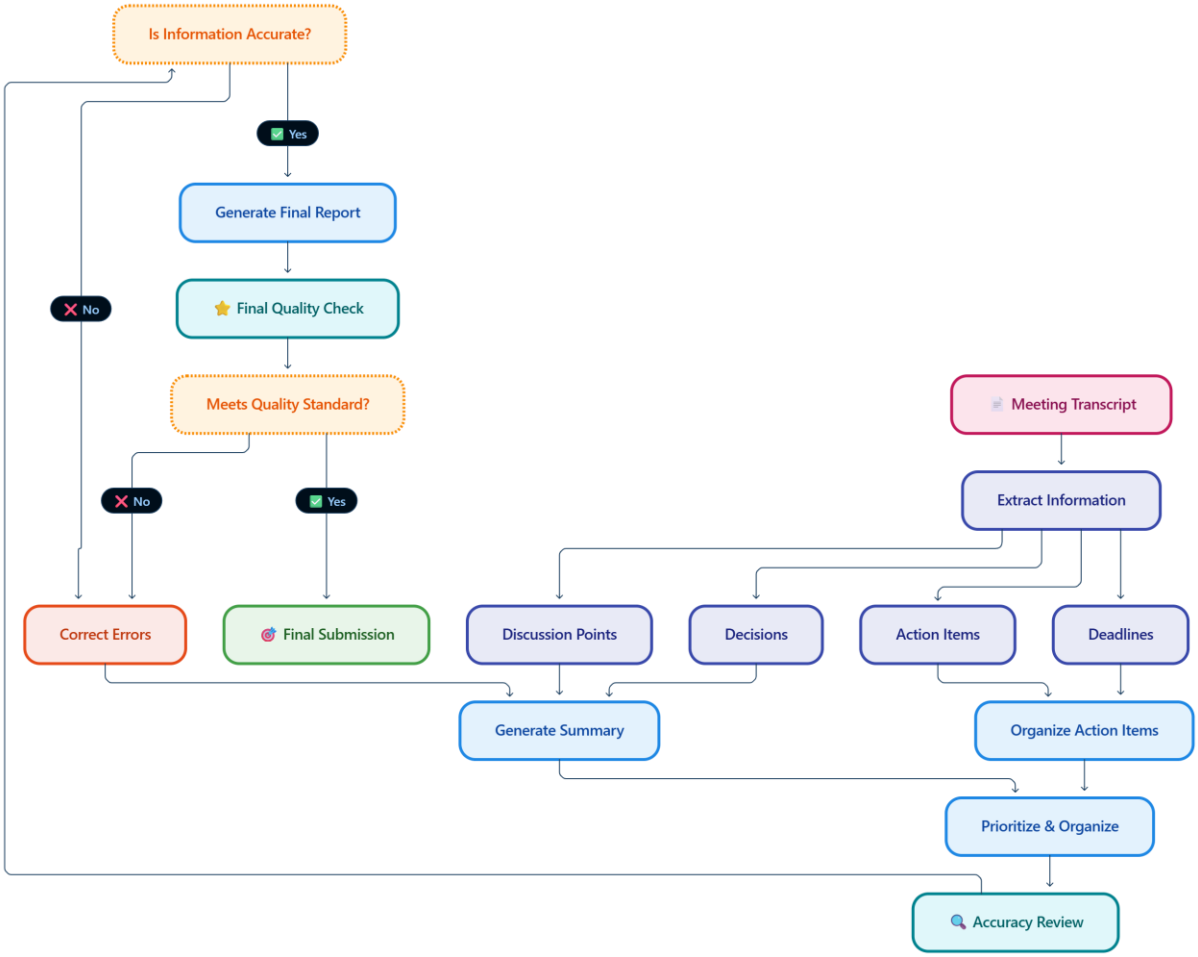

Requirements:

- Use professional language.
- Preserve the meaning of the original meeting.
- Apply all valid corrections from the review stage.
- Do not invent information.
- Clearly distinguish confirmed information from information requiring follow-up.
- Use tables where useful.

Output

A professional final meeting report and action plan.

9. Detailed AI Workflow

10. Input and Output Flow

Step	Input	Processing	Output
1. Extract Information	Meeting transcript	Information extraction	Structured meeting data
2. Generate Summary	Extracted data	Summarization	Meeting summary
3. Identify Actions	Meeting data + summary	Decision/task extraction	Decisions & action items
4. Prioritize	Action items	Priority classification	Prioritized task list
5. Review	Generated information	Accuracy validation	Corrections
6. Final Report	Validated information	Structured generation	Final meeting report

11. Example Input

Meeting Topic: Software Project Planning Meeting

Example notes:

The development team discussed the upcoming software release. The team agreed that testing should be completed before deployment. The testing team will prepare the test report. The project manager will review the report before the release decision.

The workflow converts this information into a structured summary, decisions, action items, responsibilities, and next steps.

12. Key Generative AI Concepts Demonstrated

12.1 Prompt Chaining

Each stage uses information generated by previous stages.

12.2 Information Extraction

The AI identifies important entities, decisions, tasks, and deadlines from unstructured text.

12.3 Summarization

Long meeting information is converted into concise and structured content.

12.4 Structured Output

The workflow produces organized sections and tables rather than unstructured text.

12.5 Context Management

Information is passed between multiple stages while maintaining the original context.

12.6 Validation

The AI compares generated information with the source to identify potential errors.

12.7 Iterative Refinement

If errors are detected, the workflow can return to an earlier stage and regenerate the output.

12.8 Classification

Action items are classified into priority levels based on available evidence.

13. Advantages of the Workflow

1. **Saves time** by automating meeting documentation.
2. **Improves organization** by separating discussions, decisions, and tasks.
3. **Reduces information loss** by systematically extracting important details.
4. **Improves accountability** by identifying task owners and deadlines when explicitly provided.
5. **Reduces hallucination risk** through source-based validation.

6. **Creates consistent reports** using predefined structures.
7. **Supports iterative improvement** through an error-correction loop.
8. **Reusable across different meetings** and project types.

14. Expected Final Result

The workflow produces a professional meeting report containing:

- Meeting summary
- Key discussion points
- Confirmed decisions
- Action items
- Responsible persons
- Deadlines
- Priority levels
- Follow-up requirements
- Next steps

The final output is reviewed before submission to improve accuracy and reliability.

15. Conclusion

The AI Meeting Summarizer and Action Planner demonstrates how Generative AI can transform unstructured meeting information into an organized and actionable report.

The workflow combines information extraction, summarization, prompt chaining, structured generation, classification, validation, and iterative refinement.

By introducing a dedicated review stage and a correction loop, the workflow does not simply generate content; it also checks the generated information against the original source before producing the final result.

This makes the workflow practical, reusable, and suitable for real-world Generative AI applications.
